Motivation

Transportation
accounts for
28% of the
total U.S. GHG
Emissions

- Reduce greenhouse gases emissions from:
 - ▣ Raw material extraction and/or acquisition
 - ▣ Construction material production
 - ▣ Equipment usage on site
 - ▣ Use phase
- Develop strategies to reduce greenhouse gas emissions at all levels and life cycle stages:
 - ▣ Operational: Construction, Maintenance, Rehabilitation
 - ▣ Strategic: Alternative design, improved decision processes

What is Life Cycle Assessment

Use/Service
Life emissions
account for
~90% of
pavement life
cycle emissions

- Accounting for environmental impacts through *all* the life cycle phases of products and processes
 - Mining and Extraction
 - Manufacturing
 - Transportation
 - Construction
 - Use/Service Life
 - End-of-Life

Life Cycle Assessment (LCA)

- An LCA as a decision-making tool:
 - ▣ To choose between comparable alternatives
- What is the purpose of the LCA:
 - ▣ System boundaries may be different:
 - What's in, what's not
 - ▣ Units for comparison: “functional units” may vary
 - Lane mile or volume of work done?
- Who is conducting the LCA:
 - ▣ Stakeholder perspectives vary

Technical challenges

- Life Cycle Assessment based approaches:
 - Limited standards for highway industry
 - ISO 14040, 14044 – limited guidance
 - Best approach: Univ. of California, PRC guidelines (2010)
 - Purpose not yet clear: comparisons or benchmarks?
 - Alignment of objectives: consideration of services
- Rating Systems:
 - Value laden approach
 - Tend to be prescriptive

Future of LCA Products

- Environmental Product Declarations (EPD)
 - ▣ ISO Type III Environmental Labeling
- Based on Product Category Rules (PCR)
 - ▣ Establishes scope and units of LCA
 - ▣ Categories such as Global Warming Potential, Eutrophication etc.
- Business-2-Business: Cradle to gate
- Business-2-Consumer: Cradle to grave

Pavement Use Phase

- Use phase – Highest impact
- Rolling Resistance –
 - ▣ Deflection, Roughness, Texture
 - ▣ Speed, Air Temperature
 - ▣ Pavement type
 - ▣ Grade, Super Elevation
- Different models –
 - ▣ MIRIAM
 - ▣ NCHRP 1-45 – Vehicle Operating Costs

Pavement Vehicle Interface

Objective

- Investigate factors that influence IRI:
 - How does IRI change over time?
 - What conditions influence IRI?
 - What kind of maintenance plans deliver smooth pavements?
- Relate fuel efficiency (as a function of change in IRI) to
 - Maintenance schedules
 - Pavement type
 - Regional factors.
- Take full advantage of existing work

Studies so far

- Measures how IRI influences Factor X
 - ▣ Chati et al.: How IRI impacts fuel efficiency
 - ▣ Dasari et al: How IRI impacts structural number
- Calibration of predictive systems like ME-PDG, HDM-4
 - ▣ Given a starting IRI how is it likely to change/increase as time passes
 - ▣ Based on estimation of IRI as a function of other factors (e.g. faults/cracks per unit length, etc.)

The IRI measure

- Units: in/mile or m/km
- A measured quantity – objective and reproducible
- Good replacement for subjective PASER measures
- Models exist
 - ▣ ME-PDG: NCHRP 1-37A
 - ▣ Chatti et al.: 2 m/km → 1-2% reduction in fuel consumption
- Reliable metric – generally speaking.
- Caution: using calculated values to indicate level of service – best analyzed as a measure.

The IRI measure

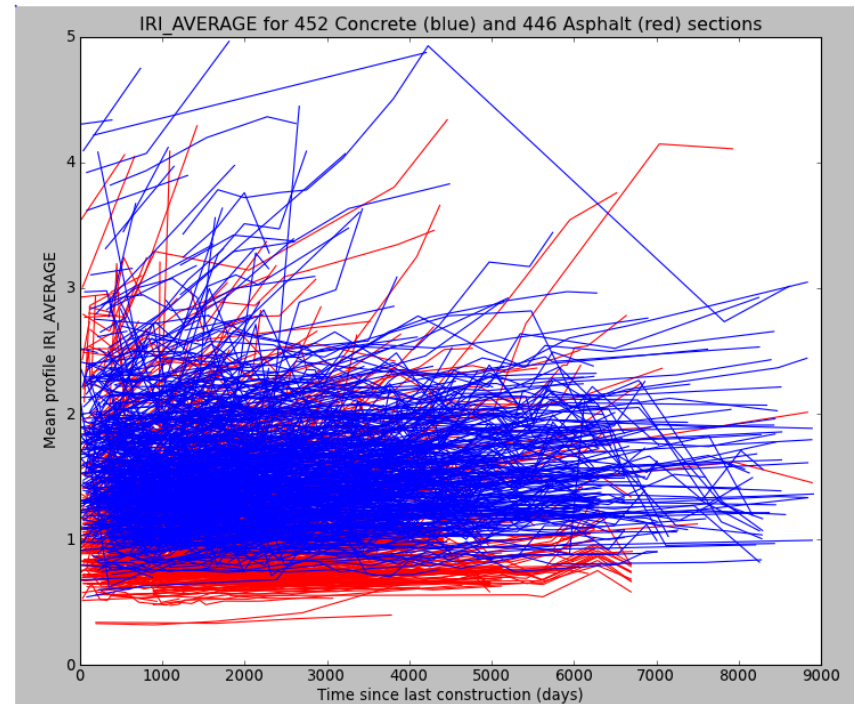

- Units: in/mile or m/km
- A measured quantity – objective and reproducible
- Good replacement for subjective PASER measures
- Models exist
 - ▣ ME-PDG: NCHRP 1-37A
 - ▣ Chatti et al.: 2 m/km → 1-2% reduction in fuel consumption
- Reliable metric – generally speaking.
- Caution: using calculated values to indicate level of service – best analyzed as a measure.

Method

- Analyze LTPP sections:
 - Clean the datasets ...
 - ... or identify suitable subset
- Cross classify by:
 - Region,
 - K-ESAL (traffic load)
 - Pavement type: AC, JPCP, CRCP (and flavors)
 - Time of day measurements

Initial plot

- Trends difficult to identify
- Possible corrupted data
- Cleaning difficult
- Required: a pre-validated dataset

Data set

- Subset that was used to calibrate ME-PDG IRI change models
- Data subset is reliable because:
 - ▣ The models ensured that calculated IRI (from models) closely co-related with the observed IRI (from LTPP)
 - ▣ Data sets are as valid as our understanding of IRI

Complicating Factors

- LTPP Dataset
 - ▣ Incomplete
 - ▣ Possibly corrupt in places
- Practices that used to be vs. that are
- Different studies for different purposes
- The data is difficult to access
- Nothing “Normal” about anything

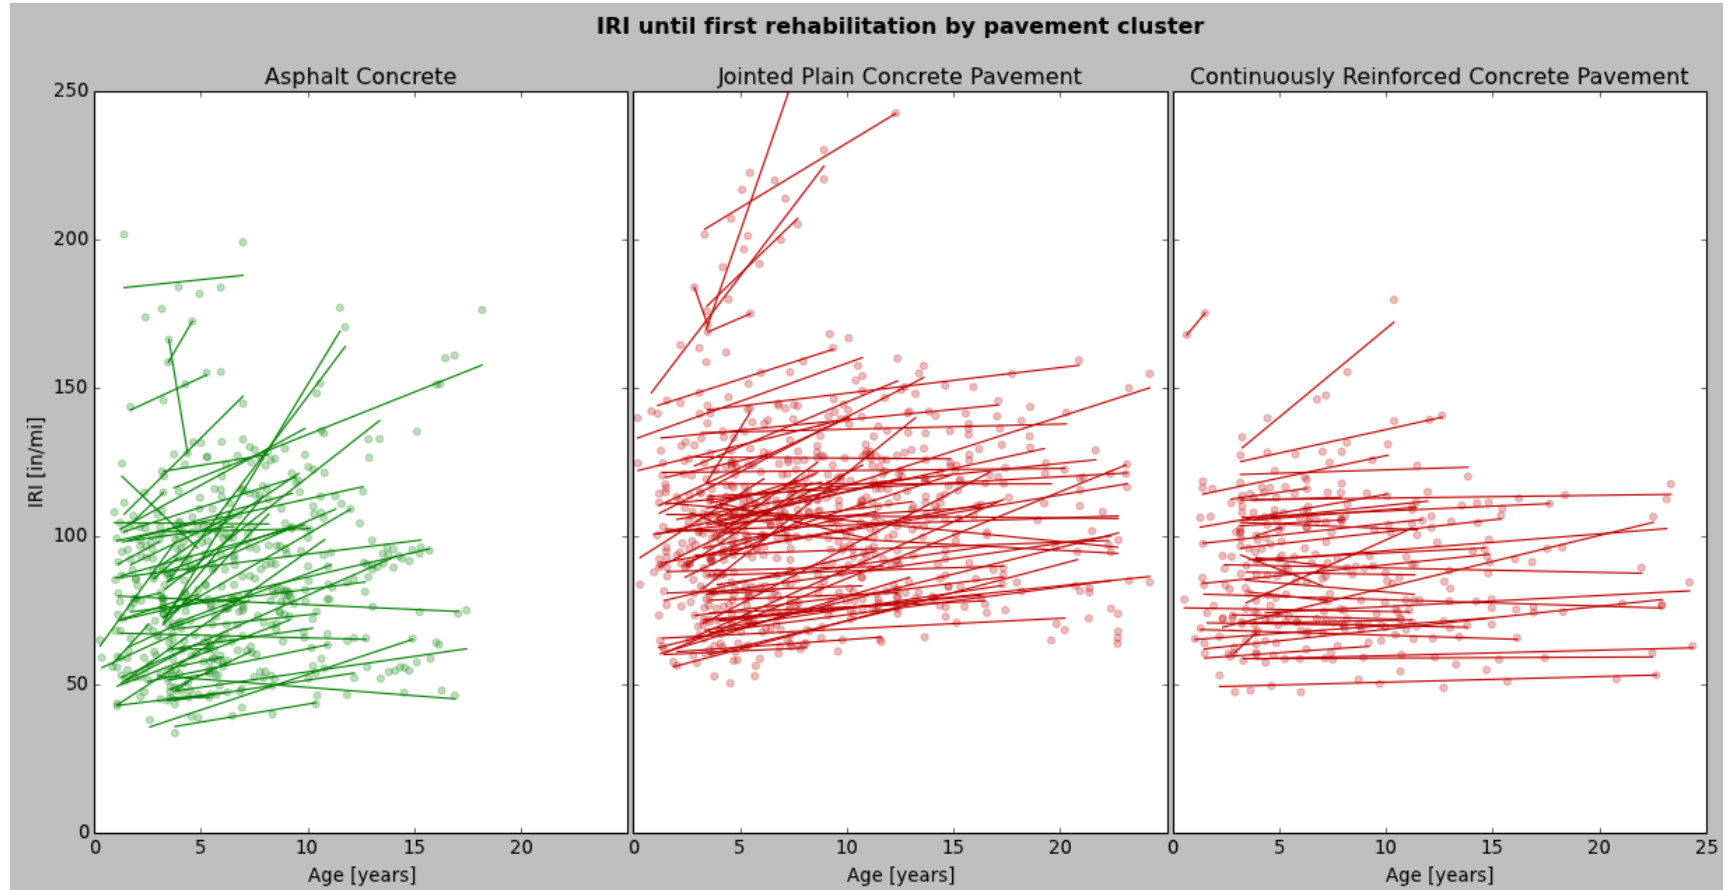

Potentially Useful Factors

- Rate of change of IRI over time
 - ▣ Initial IRI
 - ▣ Final IRI (at the time of intervention)
 - ▣ Time to intervention
- Most effective interventions
- Identify factors that impact change in IRI
 - ▣ Climate/region
 - ▣ Pavement type
 - ▣ Traffic loading
- Effective construction methods

Time to First Intervention

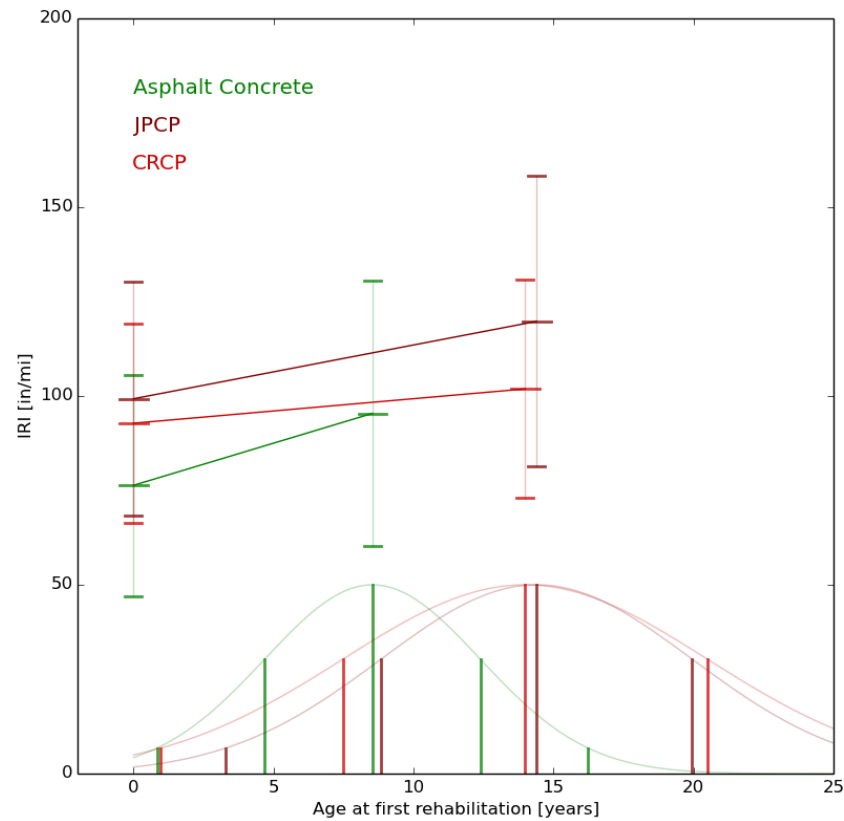

- Metric is relatively free of differing policies
- Three distributions:
 - ▣ Initial IRI
 - ▣ Final IRI (at the time of intervention)
 - ▣ Time to intervention

Basic Trends: By Pavement Type

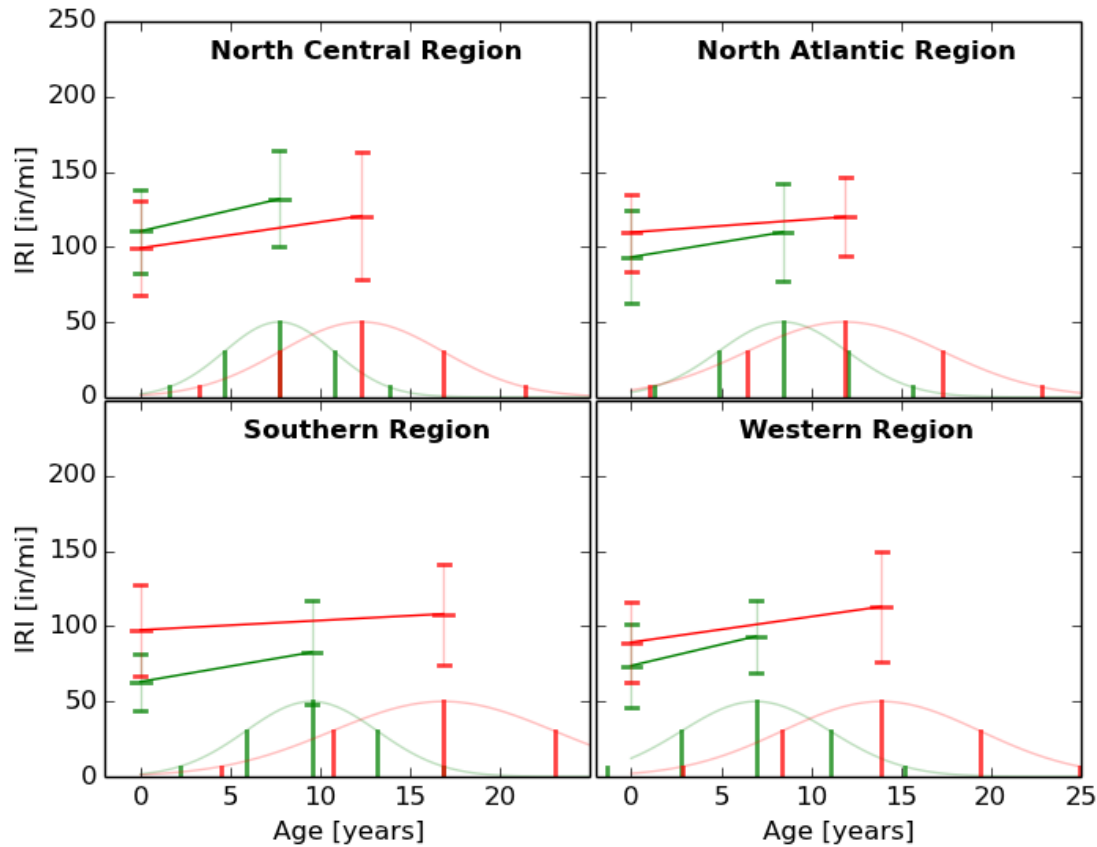

Basic Trends: By Pavement Type

IRI until first rehabilitation by pavement cluster

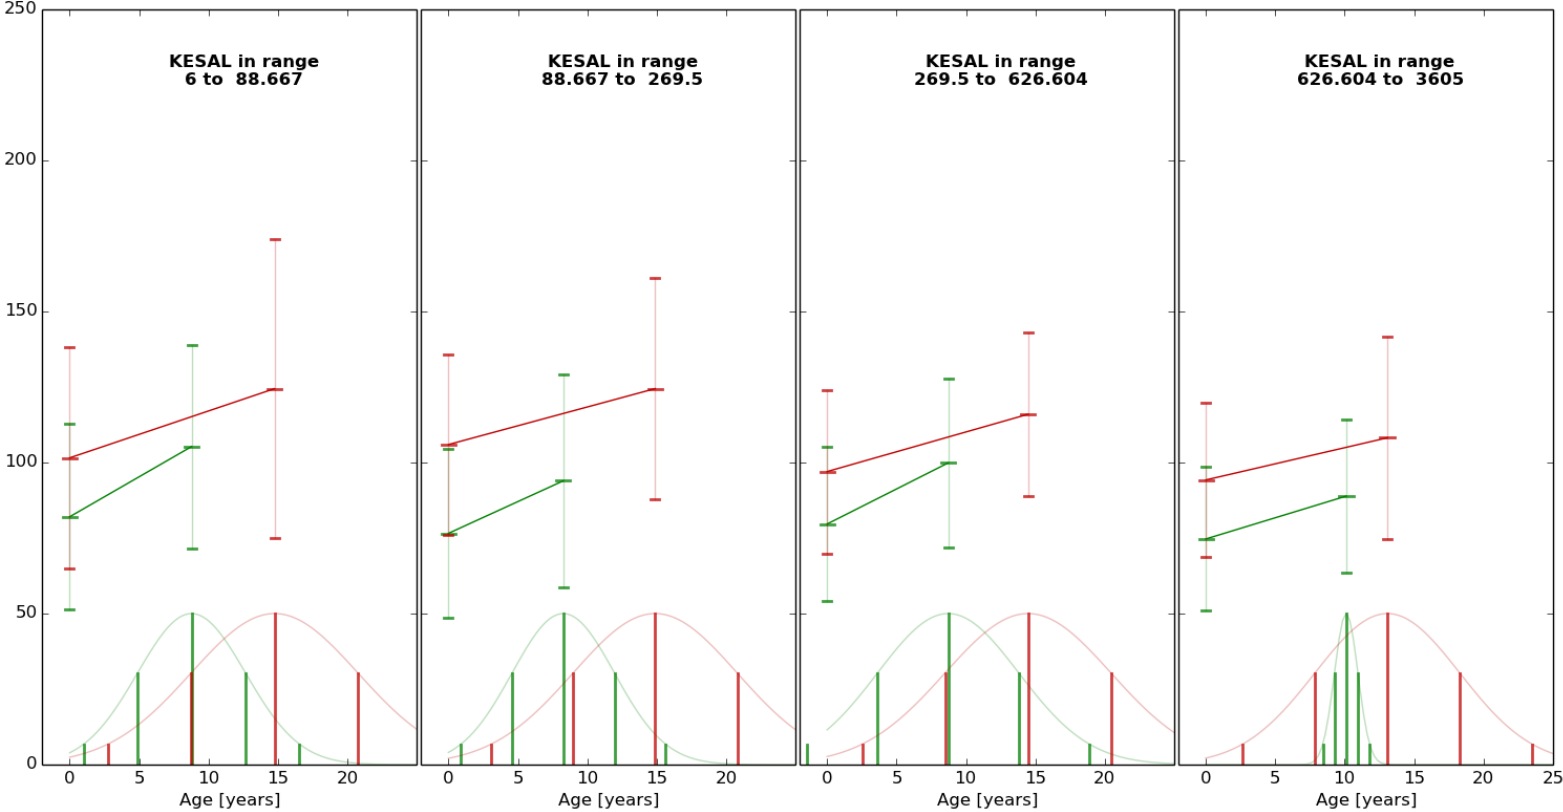

Basic Trends: By Region

IRI until first rehabilitation by region

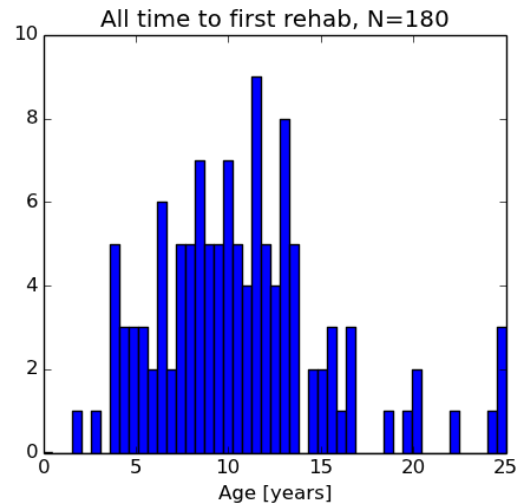

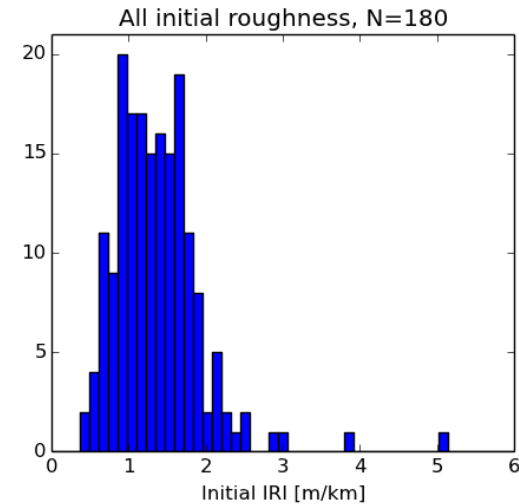

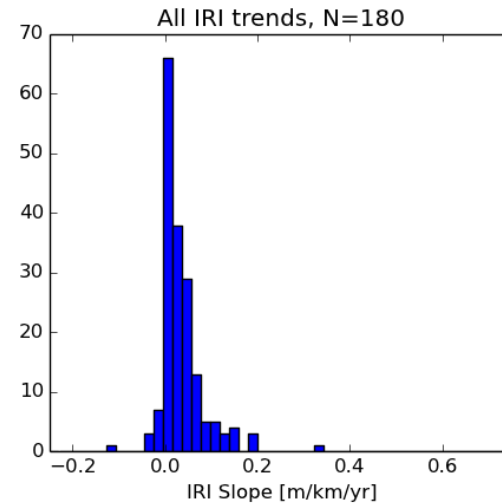

Basic Trends: By ESAL (Traffic Loading)

IRI Trends by KESAL quartile until first rehabilitation
(Green = Asphalt, Red = Concrete)

Basic Trends: All Sections

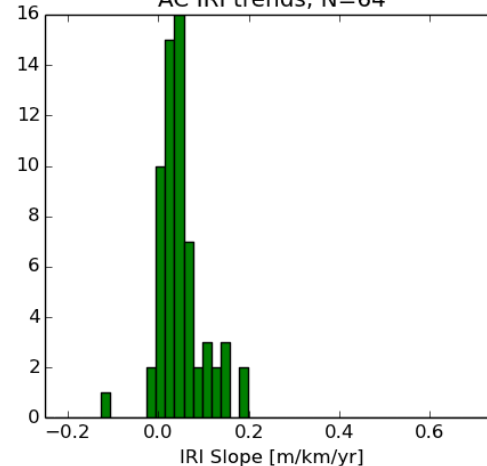

- Initial IRI: 1.35 m/km
- Final IRI: 1.92 m/km
- Time to First Intervention: 15.65 years

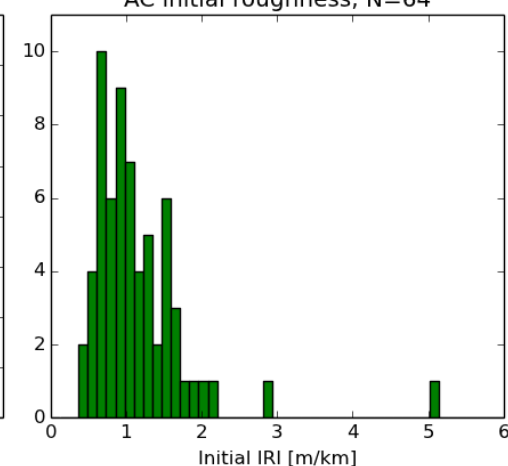

Basic Trends: Asphalt

- Initial IRI: 1.12 m/km
- Final IRI: 1.81 m/km
- Time to First Intervention: 11.97 years

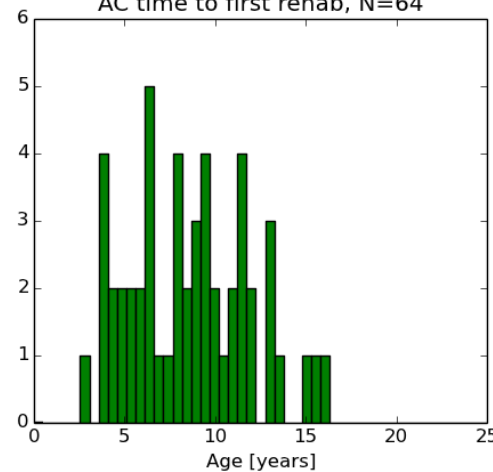

AC IRI trends, N=64

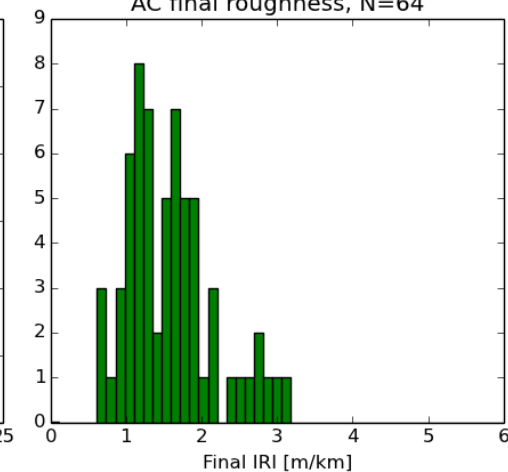

AC initial roughness, N=64

AC time to first rehab, N=64

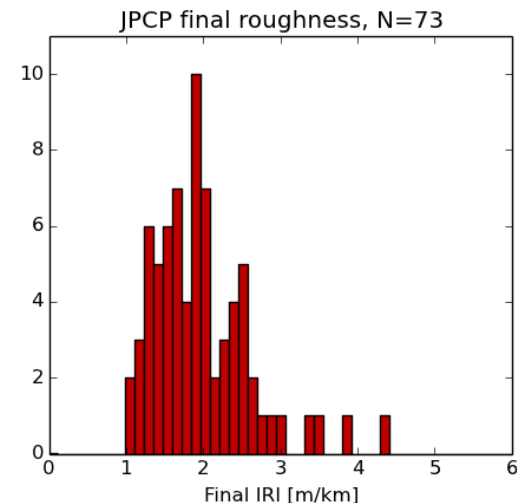

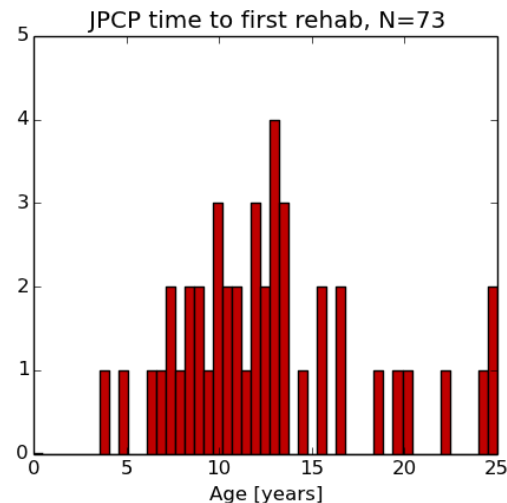

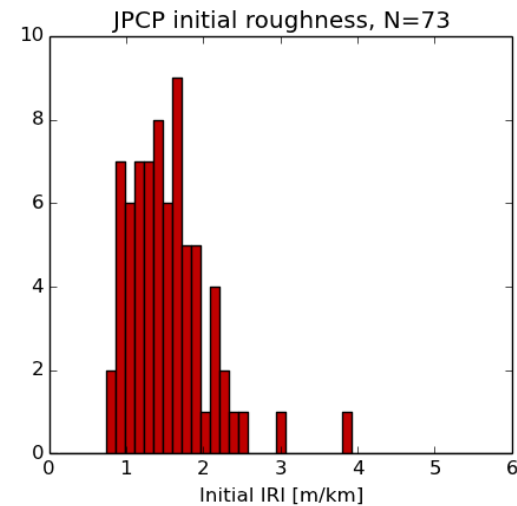

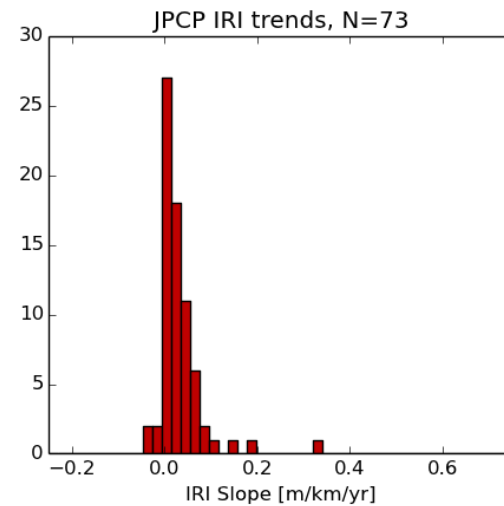

AC final roughness, N=64

Basic Trends: JPCP

- Initial IRI: 1.47 m/km
- Final IRI: 2.16 m/km
- Time to First Intervention: 17.82 years

Basic Trends: CRCP

- Initial IRI: 1.46 m/km
- Final IRI: 1.8 m/km
- Time to First Intervention: 17.15 years

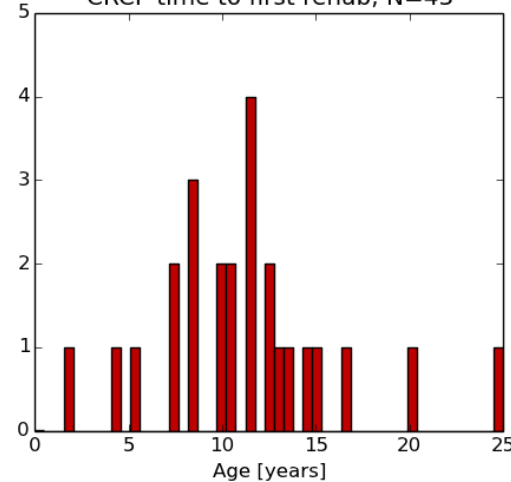

CRCP IRI trends, N=43

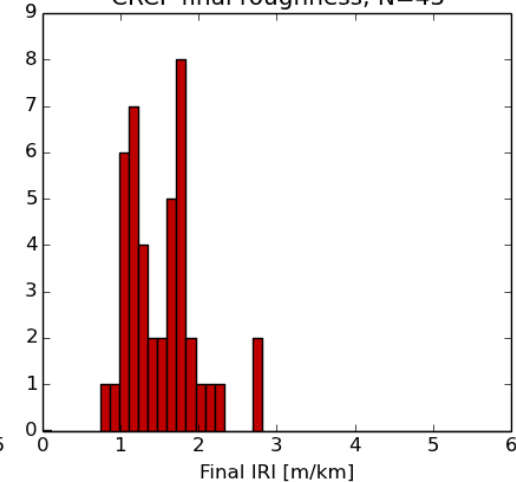

CRCP initial roughness, N=43

CRCP time to first rehab, N=43

CRCP final roughness, N=43

Basic Trends: Summarized

Significance: Statistical

- Hypothesis: No difference between rate of change of IRI between AC and XXCP
 - ▣ Consider time rate change (m/km/year)
- *p-value* of difference between time rates = 0.006
- Statistically significant difference.

Concerns

- Specify goal of study:
 - ▣ Limited overloading of models
 - ▣ Caution: sometimes benchmark, not compare
- When comparing two alternatives:
 - ▣ Defining a metric – appropriate caveats
 - ▣ Statistical significance vs. Actual significance
- Who is this study meant for?
 - ▣ The decision-making interface
- Transparency and easy repeatability

Significance: Actual

- Rate of change of IRI
 - AC: 0.06m/km/year
 - JPCP: 0.04m/km/year
- Over time period of 12 years:
 - $a = \text{Initial Diff}$
 - $b = \text{Final Diff}$
 - $t = \text{Time Period}$

$$\begin{aligned} \gamma &= \frac{1}{2} [a + b].t \\ &= 4.19 \text{ m/km.year} \end{aligned}$$

Difference of $\sim 3\text{-}4\%$ fuel consumption
up to time to first intervention

Significance: Actual

- Average fuel consumption¹:
 - ▣ Passenger vehicles: 498 gallons/year
 - ▣ Light duty trucks: 694 gallons/year
- 254,212,610 passenger vehicles and distribution²:
 - ▣ Light duty vehicle, short + long wheel base: 92.5%
 - ▣ 2 axles and 6 tires + Truck, combination: 4.3%
 - ▣ Motorcycles, etc.
- Savings per year: **433 Million gallons of gasoline**
 - ▣ 0.3% of Annual US Gasoline Consumption (2011)

¹Office of Transportation and Air Quality - EPA420-F-08-024 - October 2008

²RITA BTS Table 1-11. US Bureau of Transportation Statistics.

Critique of metric

- Penalizes Asphalt:
 - ▣ After 12 years: IRI reduces due to intervention
- Penalizes Concrete:
 - ▣ Provides a longer span to first intervention
- An appropriate metric would:

$$Y = \frac{1}{2} [a + b_1] \cdot t_1 + \frac{1}{2} [b_1 + b_2 + c] \cdot t_2$$
$$t = t_1 + t_2$$

Introduces Complications

- How do the following balance out?
 - Cost of intervention
 - Change in long-term fuel consumption
 - Life cycle impacts of materials and construction
 - Traffic loading
 - Context of network

Effective Interventions

- Full depth joint repairs (20-30% reduction in IRI)
- Slab replacement (~20% reduction in IRI)
- Surface grinding (>30% reduction in IRI)
- Surface treatments (20-40% reduction in IRI)
 - ▣ Tag coats
 - ▣ Fog seal coats
- What are the sequences?

Towards Context Sensitive Solutions

- Try not to generalize
 - ▣ Solutions must be sensitive to context
 - ▣ Transparency is critical
- Statistical significance: handle with caution
 - ▣ Nothing is “Normal”
 - ▣ Failure statistics may prove to be better suited
- Consider network based approach
 - ▣ Use actual data
 - ▣ Empower decision-makers

The Website

- Easy Access to LTPP IRI data
 - ▣ Transparency
- Allow for customized assessment by stakeholders
- Allow for network wide assessment by agencies
 - ▣ Integration with PE-2 – Project Level Perspective
